

TraxKey AI — Product Overview

Written for someone who has not seen the code.

Last updated: 14 August 2026

1. What TraxKey AI is

A team of AI agents that run a rental portfolio's operations, 24 hours a day, across both long-term units and short-term rentals, in one system.

Not a single bot bolted onto a ticketing tool. **Seven specialised agents**, each owning one workflow end to end, coordinating maintenance, turnovers, leases, guest readiness, vendor performance, and the portfolio's own trends, around the clock, without waiting on business hours. Section 4 names all seven.

Most property software is a filing cabinet: it records what happened and leaves a human to make every decision. TraxKey decides the ones that are safe to decide, and hands a human exactly the ones that need a human, with the reasoning attached. That is the difference between software that tracks your business and a platform that runs alongside it.

The pain points this replaces, not just maintenance

- **A 10pm broken heater** that needs triage, a vendor call, an approval, and a tenant update, done by a person, every time. (§2)
 - **A guest checkout at 11 and check-in at 4** that someone has to notice and race to turn around. (§3, Turnover Coordinator)
 - **A lease that quietly expires** because nobody was watching the calendar 90 days out. (§3, Lease Agent)
 - **A vendor who has gotten slower over six months** and nobody noticed because nobody was comparing this month to March. (§4, Insights Agent)
 - **An owner who calls to ask how their property is doing** because they have no way to check themselves. (§10, addresses table)
 - **A property manager who cannot tell if the business itself is healthy** — which vendor is worth keeping, which unit is underpriced, which turn pattern is costing them nights. TraxKey's Insights Agent surfaces exactly this, unprompted, from the portfolio's own history.
-

2. The problem we chose

The day this replaces

A tenant texts at 10pm that the heating has died. Someone reads it, works out it is an HVAC job not a plumbing one, digs out which contractor was any good last time, calls three of them, waits, approves a price, and remembers to tell the tenant something is happening. Multiply by every unit, every week.

That work is not skilled. It is coordination, and it is the reason a property business stops scaling at the point where one person can no longer hold it all in their head.

The pain	What TraxKey does
Every request needs a human to read and triage it	AI reads it and classifies the trade, urgency and responsibility
Picking a vendor from memory or a spreadsheet	Ranked on that vendor's own completion rate, rating and real cost
Chasing approval on every job, however small	Under your limit with a proven vendor it just goes; over it, one click
The tenant hears nothing and chases you	Emailed automatically when a vendor is assigned and when it is done
A guest complains about something you did not know was broken	The calendar tells the AI someone is in the unit, so it escalates
Finding out a unit was not ready when the guest arrives	Checked before arrival, flagged while there is still time
Discovering at renewal that a unit has been under-rented for a year	Surfaced 90 days out, with the gap against your own average
Not knowing which vendor is quietly getting worse, or which unit keeps breaking	The Insights Agent watches for it and tells you, unprompted

Why nobody has solved it for this operator

Property operators fall into two camps, and the software market matches them:

- **Long-term rentals.** Leases, renewals, tenants. Served by AppFolio, Buildium, Rentvine.

- **Short-term rentals.** Airbnb, Vrbo, guests, cleaning turnarounds. Served by Hostaway, Guesty, Hospitable, Lodgify.

A growing number of operators run **both**. Two houses on annual leases and three cabins on Airbnb is an ordinary portfolio now.

Those people are served by nobody. Short-term platforms have no concept of a lease. Long-term platforms have no concept of a booking calendar. So the operator buys two subscriptions and personally becomes the integration between them.

That gap is the entire reason TraxKey exists. It is checkable: you can visit any of those five products and confirm it in about ten minutes.

3. What it does today

The AI Maintenance Coordinator

The core loop, and it runs without a human in the middle:

1. A resident or guest reports a problem through their own link. No app, no account, no password.
2. AI reads the description and works out the trade, how urgent it is, and whether it is the owner's responsibility or the tenant's.
3. TraxKey picks the vendor, ranked on that vendor's actual completed-job history: completion rate, rating, and real cost.
4. If the expected cost is under the operator's limit and the vendor has a track record, it dispatches automatically and emails them.
5. If it is over the limit, or the vendor is new, it stops and waits for one click.
6. The resident is emailed when someone is assigned, and again when it is done.

Every step is written to a log the operator can read, in plain language, including the reason for each decision.

Everything else built

Area	What it does
Calendar	Every unit on one timeline. Guest bookings, owner blocks, leases and turn deadlines together.

Area	What it does
Leases & renewals	Terms, rent, deposits. Flags every lease 90 days before it ends and tracks the renewal offer.
Turns	Vacant-to-ready tracking. A guest checkout opens a cleaning turn automatically with the next arrival as its deadline.
Cleaner assignment	A cleaning turn assigns a cleaner by itself, ranked the same way any vendor is.
Inspections	Move-in and move-out condition records, and exactly what changed between them.
Business Memory	Rules the AI obeys: approval limits, quiet hours, preferred vendors, set per trade, property or unit.
Insights	Patterns in the operator's own data: vendors slowing down, units that keep breaking, rents below their own average.
Orders	Parts and materials a job is waiting on, flagged when late, and when late means a turn will slip. Adapted from our own supply-chain product, TraxSail AI, which chases suppliers on purchase orders.
Supplies & damage	Consumables per unit with reorder levels; checkout damage tied to the stay it happened during.
Vendor portal	Vendors log in, see their jobs, mark them in progress.
Owner portal	Owners you manage for see occupancy, spend, and activity for their own properties, read-only. Never see another owner's properties or any tenant's identity.
Tenant portal	Residents and guests report problems, with a warm AI assistant and a "talk to a person" escape hatch.

Area	What it does
Daily briefing	A short read every morning: what is urgent, what is handled, what is waiting on a decision.

4. The specialised AI agents

Each owns one workflow end to end and runs on its own schedule. They share the portfolio, the vendor network, and the operator's rules, which is what makes them a platform rather than a bundle of features.

Agent	What it owns	Runs
Maintenance Coordinator	Diagnose a reported problem, match a vendor, gate on cost, dispatch	On every new request
Turnover Coordinator	Open a cleaning turn on checkout, set the deadline from the next arrival, assign a cleaner	Hourly
Lease Agent	Activate and end lease terms, flag silent renewal offers, open move-out turns	Hourly
Readiness Agent	Check a unit is actually ready before a guest arrives	Hourly
Review-Risk Agent	Flag a stay that ended with an issue still open	Hourly
Insights Agent	Vendor slowdowns, repeat-failure units, below-average rents, late parts blocking a turn	Daily
Follow-up Agent	Keep residents and guests informed; chase leads who never converted	Every 15 min

The three assistants, and why they sound different

Three separate AI personalities, because they are talking to three different people in three different situations. Using one voice for all three would be a mistake.

1. The operator concierge (dashboard). Briefs a professional on their own portfolio. Terse, ranked by urgency, no softening. Opens with the single most important thing, then a short list of what to do today. Every number in it is counted from real data, never estimated.

2. The resident and guest assistant (reporting page). Talks to someone who may be cold, flooded, or locked out, and who never chose this software. Warm, short sentences, acknowledges the problem before solving it. Helps them describe the fault clearly, which is what gets the right trade sent first time.

It is also the **most restricted** AI in the platform. It cannot promise a time, a cost, who pays, or that anything will be fixed, because it cannot see the schedule or the lease. For a gas smell or fire it says leave and call 911 before anything else. A "talk to a person" button is always one tap away, and if the operator has switched off automated handling for that resident, the AI step is skipped entirely.

3. The sales assistant (public site). Answers prospect questions from a fixed product brief with no database access. It is instructed to name competitors where they are genuinely better, and it does.

What "learning" does and does not mean here

Worth being exact, because the honest version is a selling point.

Mechanism	What it is
Vendor performance	Every completed job updates that vendor's record. The AI's next choice differs because the evidence changed. Genuine learning from outcomes.
Business Memory	Rules the operator sets: approval limits, quiet hours, preferred vendors, per trade, property or unit. The AI reads these as facts and obeys them.
Insights	Patterns computed from the operator's own history and surfaced as suggestions.

The AI never rewrites its own rules. It can tell an operator "you have approved HVAC over your limit nine times out of ten, want to raise it?" It cannot raise it. Nothing silently changes the system's risk posture, which is the failure mode that destroys trust in one incident.

There is no model fine-tuning on customer data. "Memory" is durable database rows, which is why it is inspectable and reversible.

5. The design rule everything follows

The AI classifies. Software decides.

The only thing the AI is trusted with is reading a free-text description written by a stressed human and working out what it means. That is a genuine language problem and AI is good at it.

Everything after that is ordinary, testable logic:

Step	How it works
Understand "the boiler is making a banging noise"	AI
Which vendor is best for this	Arithmetic on their job history
Is this within the spending limit	Comparison
Is a guest in the unit right now	The booking calendar
Is this unit ready for the next arrival	Checklist state
Is this vendor slower than they used to be	Their own history

This matters commercially, not just technically. It is why TraxKey can show an operator the reason for every decision, and why the AI **cannot** invent a cost, choose a vendor it likes, or quietly change a rule the operator set.

6. Things we deliberately do not build

Stated plainly because it is a strategy, not a gap:

Not building	Why
Rent collection, trust accounting	Regulated, and a mistake is the operator's legal problem. It sits alongside whatever already moves their money.
Tenant screening scores	Governed by fair-credit law. We would integrate a licensed provider, never score anyone ourselves.
Deposit deduction amounts	Governed by state law that varies everywhere. TraxKey records what changed and a human decides.
Dynamic pricing	Needs market data we do not have. PriceLabs already does it well.
Writing back to Airbnb/Vrbo	Requires partner agreements we do not have. Reading their calendars does not, and is enough.

The pattern: **TraxKey handles operations. It never handles money or makes a legal determination.**

7. Who it is for

Portfolio	Fit
Short-term only	Works, but Breezeway and Hostaway have deeper turnover tooling. Worth switching only if maintenance is the weak spot.
Both long-term and short-term	The one nobody else serves. This is the customer.
Long-term only	Works well, unless accounting is needed today. Then AppFolio or Buildium is the right answer.

Built for roughly **5 to 150 units**. Above that, the incumbents' depth wins and we would rather say so.

8. Pricing

Tier	Units	Price
Free	1	\$0
Starter	2–10	\$99/mo
Growth	11–50	\$249/mo
Pro	51–150	\$549/mo

No credit card to start. No per-seat charge, so adding staff costs nothing.

The comparison that matters is not TraxKey against any single competitor. A mixed operator today pays for a short-term platform **and** a property management system, often with a maintenance tool on top. TraxKey is one subscription covering both.

9. Honest position, as of today

Worth stating directly because anyone evaluating this will find it out.

Where we are behind. Hostaway, Guesty, Hospitable, Lodgify and Buildium are established businesses with large teams. Their short-term turnover tooling and their accounting are more mature than ours. All five have also shipped their own AI assistant, so AI alone is no longer a differentiator in this market.

Where we are genuinely ahead.

1. **Both sides in one system.** Structural, not cosmetic. A short-term platform would need to build leasing; a property system would need to build channel calendars. Neither is a quick addition.
2. **Occupancy-aware urgency.** A broken air conditioner with a guest inside is treated differently from the same fault in a unit empty for two weeks. This requires the booking calendar and the maintenance engine in the same system, which is exactly what nobody else has.
3. **A readable audit trail.** Every AI decision is logged with its reasoning in plain language. Most AI tools cannot show this.

4. **AI that cannot overrule the operator.** Rules are facts the AI obeys and never rewrites. It can suggest raising a limit. It cannot raise one.

Status. The platform is built and running. No paying customers yet. The current bottleneck is distribution, not features.

10. How it is built

Addresses

Address	Who uses it
traxkey.ai	Public marketing site
traxkey.ai/short-term-rentals	Short-term operator landing page
traxkey.ai/demo	Interactive dashboard demo, no signup
app.traxkey.ai	Operator dashboard (the main product)
vendors.traxkey.ai	Vendor portal, where contractors see and update their jobs
owners.traxkey.ai (<i>DNS in progress</i>)	Owner portal: a read-only view of an owner's own properties, occupancy, 12-month spend, and recent work
app.traxkey.ai/admin	Internal admin, our own metrics. Not customer facing
tenant.traxkey.ai	Residents and guests report problems. No login

Inside the operator dashboard

Calendar · AI Activity · Turns · Orders · Inspections · Properties & Units · Residents & Guests · Leases · Insights · Supplies & Damage · Vendors · Business Memory · Connect Airbnb & Vrbo

Behind them: a workflow engine handling web requests, a separate always-on service running the AI and the scheduled work, and a Postgres database. The two services share only the database and never call each other, so a fault in one cannot take down the other.

Every company's data is isolated at the database level on every single query. Residents, vendors, staff and administrators use separate login systems that never share a session, so a compromise in one cannot reach another.

11. What is next

Next	Why
Text-message updates	Email works today. Text is what residents actually read.
Inbound reply handling	Today TraxKey sends updates but does not read replies. Competitors auto-answer inbound guest messages; we do not yet.
Tenant logins for long-term residents	Request history, documents, renewal offers. Short-term guests keep the no-login link.
Subscription billing	Plans exist; taking payment does not yet.
Document storage	Leases, insurance, notices. Unglamorous and its absence is disqualifying.
